Accessibility Conformance and Inclusive Quality Build

1. Test Scope

- a. **Home Page:** Tested the home page to make sure that the self-portrait image adjusts as the home page adjusts depending on the device width viewing the page. Also checked to make sure that the texts and image adjust as well to stack as the page shrinks. Tested the call to action and main heading navigation as well.
- b. **Projects Page:** Tested the project cards and made sure they're responsive and that the images only appear on the smaller screen sizes. Double-checked that the links work and that specific image sizes are loaded according to the screen size viewing the content.
- c. **Contact Page:** Made sure that the required state is applied to the email field so that an error appears if an invalid email is entered. For now, contact link in main nav scrolls to section on home page but will redirect to the contact page once created.

2. Semantic Structure

- The document has button html elements and inputs for the contact form.
- Each page has its own unique title (Home, About me, Projects, Skills, Contact)
- Landmark elements were used: aria - main nav, footer, form, section

- Proper headings used: one h1 for page title, h2 & h3 used for section headings
- Links all functioning and labeled correctly

3. Keyboard and Focus

- Keyboard access confirmed (able to use tab button to navigate)
- Skip to main link added
- Focus indicator included to show what the user is currently interacting with
- Tested for keyboard traps

4. Zoom, reflow, text spacing and contrast:

- Tested site at various zoom levels (200% included) and found no issue reading text
- Contrast passed testing for color scheme used on the site
- Body line-height is 1.6 and the layouts are spaced using rem based tokens

5. Forms and Tables

- **Form:** the email field has a “required state” for an email so that it will generate an error code if an actual email isn’t inputted into the form. Visible label used “email.”
- **Tables:** N/A

6. Media, motion and alternatives

- Informative images used and include a descriptive alt text.
- Decorative images (social media icons/techstack icons) have just alt=”” instead.
- Embedded iframe youtube video has meaningful title and a backup external link incase the video doesn’t load.

- Lazy load included so that the video doesn't load before the user reaches that portion of the page
- Smooth scrolling motion included for any transitions or in-page navigation.
- Added a "prefers reduced motion" media query as well
- PNG favicon (no SVG)
- No captions/transcripts needed for lofi music video chosen

7. Automated and manual evidence

- Nu HTML Checker used and brought up no syntax errors.
- Also used CSS checker as well and brought up no errors
- Manual keyboard check (no keyboard traps, focus indicator present, tab functions properly to navigate pages/links)

8. Screen reader or accessibility-tree sampling

Sampled: "Contact Me" form:

- Named section "Contact Me"
- email label with text box "Email Address" that includes a required state and placeholder
- Submit button included
- Native html (label/input/buttons)

9. Remediation Log

Finding	Impact	Priority	Fix	Result	Status
About Me navigation used "#"	Link didn't navigate anywhere	High	Added #about section	Link now has a working target	Fixed

No skip link	Keyboard users couldn't tab through main content w/o crossing the nav links	High	Added skip to main content link	Now keyboard users can skip the nav links and tab main content	Fixed
Contact form had no label/placeholder	Users couldn't easily tell what to input	Medium	Added proper html native labels & placeholder text	Now users now syntax required for valid email input	Fixed
Rigid motion	Users with motion sensitivity could have issues with quick jumping buttons/links	Medium	Added a smooth scroll feature and prefers-reduced-motion media query	Prefers-reduced-motion present for motion sensitivity and smooth scroll for in-page nav	Fixed
Non-specific wording on Project cards	Hard for Users to tell what the links were really for	Medium	Changed "view projects" to "view graphic design projects" and "view web development projects"	Link names are easier for users and screen readers to understand	Fixed

10. Conformance Summary

The portfolio site has a much stronger structure now that it prioritized native html and responsive/mobile-first design. It has thoroughly been tested for accessibility concerns and now allows for skip-to-main content and keyboard navigation. Visible focus indicators on the interacted with page content and responsive containers/text/images. The images have srcsets with

different sizes dimensions to pull from and the embedded video has a predetermined aspect-ratio for the video to load into. The contact form has a “required state” email field with placeholder text for users to understand the syntax of the emails they need to input should be. The site has also been tested at 200% zoom and the text is readable. Before final publish, I will test everything again and run a lighthouse/Nu check on everything. I will test that the site behaves the same across different web browsers and screen sizes. The site will also need to be tested with a screen reader as well.

11. AI Disclosure

I used AI to understand vocabulary like “landmarks” and “remediated” to make sure I know what the rubric’s asking for and how it ties into the system we’re learning.
